

Amendment(s) to the Claims:

In compliance with the Revised Amendment Format, a complete listing of claims is provided herein.

1. (Original) A remote control system comprising:
 - a terminal device having a control program;
 - a server connected to said terminal device, for transmitting control data and for registering three-dimensional model data concerning said terminal device; and
 - a client connected to said server, for receiving said three-dimensional model data, wherein said client performs an additional operation upon the receipt of specific three-dimensional model data from said server, and transmits, to said server, update data for changing a three-dimensional model, which are obtained by said additional operation, and wherein said server transmits, to said terminal device, said control data based on said update data for a three-dimensional model received from said client.
2. (Original) The remote control system according to claim 1, wherein, based on said update data for a three-dimensional model received from said client, said server transmits operation control data to said terminal device, and said control program of said terminal device interprets said operation control data for said operation of said terminal device, and transmits, to said server, control data for reflecting said operating results.
3. (Original) The remote control system according to claim 2, wherein, based on said control data received from said terminal device, said server adjusts said three-dimensional model data to reflect the current state of said terminal device, and transmits the resultant three-dimensional model data to said client.

JA999144

4. (Original) A server-client system comprising:

a server, in which are stored three-dimensional model data, consisting of a Java program file concerning a connected terminal device;

a first client connected to said server via a network, for calling for and for displaying specific three-dimensional model data included in said three-dimensional model data that are stored in said server; and

a second client connected to said server via said network, for employing a web browser to designate a URL for said specific three-dimensional model data that are called for by said first client, and for downloading and displaying said specific three-dimensional model data received from said server so as to share said specific three-dimensional model data with said first client.

5. (Original) The server-client system according to claim 4, wherein said three-dimensional model data, which consists of said Java program file stored in said server, includes a program for controlling said terminal device, and said first and said second clients display the values of said three-dimensional model data to reflect the current control state of said terminal device.

6. (Original) The server-client system according to claim 4, wherein one of said first and said second clients is a computer at a customer support center that supports said terminal device.

7. (Original) A control server for a terminal device comprising:

a terminal device function control program, for exchanging control data for a terminal device connected to an internal network and for controlling the functions of said terminal device;

three-dimensional model data, including geometrical data for said terminal device and device operating data that are received by said terminal device function control program and reflect the operating results of said terminal device; and

a module, for recording an operation performed by a user as an operation event and for replaying, as needed, said operation event.

8. (Original) The control server according to claim 7, wherein said module employs recording/replaying software to record, as a VRML operation event, an operation performed by a user that is generated via a VRML browser, and replays and displays said VRML operation event via said VRML browser.

9. (Original) The control server according to claim 8, wherein an operation performed by said user is represented by the performance of an operation based on VRML contents, which are three-dimensional model data written for said VRML browser using a VRML format.

10. (Original) The control server according to claim 7, further comprising:
a client connected to an external network; and
a module for exchanging an operation event with said client via said external network.

11. (Currently amended) A terminal device control method whereby a client exercises remote control of a terminal device comprising the steps of:

designating a web browser at said client to designate a URI corresponding to said terminal device, and downloading three-dimensional model data concerning said terminal device;

rendering said three-dimensional model data that are downloaded, and reading a control program that is correlated through the designation of said URI; and

transmitting operation control data to said terminal device in response to an operation where a user performs with said three-dimensional model that is rendered by said client.

12. (Original) The terminal device control method according to claim 11, wherein said step of transmitting said operation control data to said terminal device includes the steps of:

transmitting, to a server, an update value of said three-dimensional model data obtained by said client; and

employing said update value to transmit said operation control data from said server to said terminal device.

-5-

JA999144

13. (Original) The terminal device control method according to claim 11, further comprising the steps of:

transmitting control data for reflecting operating results from said terminal device to said server; and

reflecting said control data to said three-dimensional model data, and transmitting the resultant three-dimensional model data from said server to said client.

14. (Currently amended) A terminal device sharing method, for sharing among a plurality of clients information concerning a terminal device, comprising the steps of:

employing a web browser at a first client to designate a URL corresponding to said terminal device, and downloading model data concerning said terminal device;

rendering said model data that are downloaded;

preparing shared data by operating said model data that are rendered by said first client, and transmitting said data used in common;

employing a web browser of a second client to designate a URL corresponding to said terminal device, and downloading model data concerning said terminal device; and

receiving said data used in common from said first client and employing said data used in common to update said values of said model data.

15. (Original) Storage media on which a computer stores a computer-readable program that permits said computer to perform:

a process of calling for three-dimensional model data concerning a terminal device connected to a network;

a process of rendering said three-dimensional model data that has been called for;

a process of calling for a control file associated with said three-dimensional model data; and

a process of receiving control data from said terminal device and of reflecting the received control data to said three-dimensional model data.

-6-

JA999144

16. (Original) Storage media according to claim 15, wherein said computer-readable program further comprises: a process of receiving updated values of three-dimensional model data from a client connected to an external network, and of transmitting said control data to said terminal device.

17. (Original) Storage media on which a computer stores a computer-executable program that permits said computer to perform:

- a process of calling for the transmission, via an external network, of three-dimensional model data concerning a terminal device;

- a process of rendering said three-dimensional model data that is called for;

- a process of calling for a control file associated with said three-dimensional model data;

- a process of reflecting said control file to values of said three-dimensional model data; and

- a process of changing the values of said three-dimensional model data based on the operation for said three-dimensional model.

18. (Original) A program transmission apparatus comprising:

- storage means for storing a program that executes a process of calling for the transmission, via an external network, of three-dimensional model data concerning a terminal device, a process of rendering said three-dimensional model data that has been called for, a process of calling for a control file associated with said three-dimensional model data, a process of reflecting the values in said control file to the values of said three-dimensional model data, and a process of changing the values of said three-dimensional model data based on an operation performed by a user for said three-dimensional model; and

- transmission means for reading said program from said storage means and for transmitting said program to an external computer.

-7-

JA999144

19. (Previously Presented) The remote control system of claim 1, further comprising:

a second client connected to said server, for employing a web browser to designate a URL for said specific three-dimensional model data, and for downloading said specific three-dimensional model data so as to share said specific three-dimensional model data with said client;

wherein said server further comprises a module for recording an operation performed by a user as an operation event and for replaying, as needed, said operation event.

20. (New) The terminal device sharing method of claim 14, wherein the model data comprises three-dimensional model data concerning said terminal device.
